

# STRAIGHT LINES

## Distance between two points

Distance between two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is

$$d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$

midpoint of line joining two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is

$$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

## Slope of a line

The slope of a line is the ' $\tan$ ' of the angle the line makes with the positive direction of the x-axis. If  $\theta$  is the angle then, slope =  $\tan\theta$ .

The slope of a line passing through two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is  $\frac{y_2 - y_1}{x_2 - x_1}$

- The slope of the x-axis is zero and that of the y-axis is not defined.
- Parallel lines have the same slope.
- The product of the slopes of perpendicular lines is -1.
- The slope is positive if  $\theta < 90^\circ$ . The slope is negative if  $\theta > 90^\circ$ .
- If three points A, B, and C are collinear, then AB and BC have the same slope.
- If  $m_1$  and  $m_2$  be slopes of two lines then,  $\theta$  the angle between is given by  $\tan\theta = \left| \frac{m_2 - m_1}{1 + m_1 m_2} \right|$ ,  $1 + m_1 m_2 \neq 0$

## Equation of a line

- Equation of x-axis is  $y = 0$ .
- Equation of y-axis is  $x = 0$ .
- The equation of a horizontal line is  $y = a$ . If ' $a$ ' is positive then the line is above the x-axis and if negative it will be below the x-axis.
- The equation of a vertical line is  $x = a$ . If ' $a$ ' is positive then the line is to the right of the x-axis and if negative it will be to the left of the x-axis.

## Point-slope form

$y - y_1 = m(x - x_1)$ , where ' $m$ ' is the slope and  $(x_1, y_1)$  is a point on the line.

## Two-Point form

$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)$  where  $(x_1, y_1)$  and  $(x_2, y_2)$  are two point on the line.

## Slope intercept form

1.  $y = mx + c$ , where  $m$  is the slope and  $c$  is the y-intercept. 2.  $y = m(x - d)$ , where  $m$  is the slope and  $d$  is the x-intercept.

## Intercept form

$\frac{x}{a} + \frac{y}{b} = 1$ , where  $a$  and  $b$  are x and y intercept respectively.

## Normal form

$x \cos\theta + y \sin\theta = p$ , where  $p$  is the length of the normal from the origin to the line and  $\theta$  is the angle the normal makes with the positive direction of the x-axis.

## General Equation of a line

General equation of a Line:  $ax + by + c = 0$ , where  $a$ ,  $b$  and  $c$  are real constants.

- x intercept of the line  $ax + by + c = 0$  is  $-\frac{c}{a}$
- y intercept of the line  $ax + by + c = 0$  is  $-\frac{c}{b}$
- Slope of the line  $ax + by + c = 0$  is  $-\frac{a}{b}$
- Parallel lines differ in constant term, i.e; a line parallel to  $ax + by + c = 0$  is  $ax + by + k = 0$ .
- A line perpendicular to  $ax + by + c = 0$  is  $bx - ay + k = 0$ .
- The equation of the family of lines passing through the intersection of the lines  $a_1x + b_1y + c_1 = 0$  and  $a_2x + b_2y + c_2 = 0$  is of the form  $a_1x + b_1y + c_1 + k(a_2x + b_2y + c_2) = 0$ .

- The perpendicular distance of a point  $(x_1, y_1)$  from the line  $ax + by + c = 0$  is  $\left| \frac{ax_1 + by_1 + c}{\sqrt{a^2 + b^2}} \right|$
- The distance between the parallel lines  $ax + by + c = 0$  and  $ax + by + k = 0$  is  $\left| \frac{c - k}{\sqrt{a^2 + b^2}} \right|$
- Normal form of the equation  $ax + by + c = 0$  is  $x \cos \theta + y \sin \theta = p$ ; where  $\cos \theta = \pm \frac{a}{\sqrt{a^2 + b^2}}$  :  $\sin \theta = \pm \frac{b}{\sqrt{a^2 + b^2}}$  and  $p = \pm \frac{c}{\sqrt{a^2 + b^2}}$
